Docket No.: LSN-4cdXCD1
Serial No. 10/736,804Remarks

The invention is a pedestal to support a component. The component, for example, can be a table top. The pedestal of the subject invention supports that table top so its position can be freely changed above the pedestal. Movement including height from the ground and attitude of the table top are accomplished with telescoping support mechanisms. These telescoping support mechanisms when unevenly loaded can bind. The subject pedestal provides that the component is pivotally and slideably secured to the table top and therefore allows the telescoping support mechanisms to remain aligned and functioning.

Applicant invites the Examiner to call the undersigned if clarification is needed on any of this response, or if the Examiner believes a telephonic interview would expedite the prosecution of the subject application to completion.

Respectfully submitted,

Jean Kyle
